

Workflow and structure explained

An AI-powered personal assistant that lives inside Telegram. You send it a voice note or text message, and it handles real tasks — emails, calendar, contacts, research — and replies back in either voice or text.

The tech stack:

- **n8n** (workflow automation) as the orchestration layer
- **Google Gemini** as the core LLM powering the AI agent
- **Groq** for fast speech-to-text (whisper) transcription
- **VoiceRSS** for text-to-speech on the output side
- **Telegram Bot API** as the interface (input + output)
- **OpenRouter** as a secondary LLM for the TTS formatting step
- A **window memory buffer** so the agent remembers context across messages
